
Pitch Insight Interview Cheat Sheet

Use this for quick revision before the interview.

30-Second Pitch

Pitch Insight is a cricket pitch analysis platform. It uses computer vision and machine learning to detect the pitch, extract surface features, classify pitch type, and combine that with weather and domain rules to recommend match strategy. It also includes auth, subscriptions, analysis history, and a Pro chat assistant.

Architecture

Frontend: React + Vite. Backend: FastAPI with modular routers. Database: MongoDB. ML: YOLO pitch detection, OpenCV feature extraction, and ONNX-based classification. External integrations: Weather API, Gemini, and Razorpay.

Core Flow

Upload image -> detect pitch region -> extract features -> classify pitch type -> apply feature and weather adjustments -> generate strategy -> return results to the UI.

Most Likely Questions

Why FastAPI? Strong validation, docs, and router structure. Why ONNX? Faster and lightweight inference. What is the difference between quick and complete analysis? Quick is fast classification; complete adds richer features and weather. How is Pro access handled? JWT auth plus Razorpay payment verification. Where is history stored? MongoDB analysis history collection.

Strong Closing Line

The project solves a real cricket decision problem by converting pitch images into actionable, explainable insights for match preparation.
